

In the Claims:

✓ Please cancel all currently pending claims and substitute the following set of new claims 1-35.

- AA
- 1. (New) A closure device for sterile closure of a connection of a filter module for dialysis, hemofiltration or ultrafiltration, comprising:
- a closure element;
 - a wall formed in the closure element having an automatically closing slit-shaped indentation forming a germ-proof closure when closed; and
 - means for fastening the closure element to a connecting element, the means being disposed adjacent to the wall.
2. (New) The closure device according to claim 1, wherein the closure element is substantially cylindrical, the fastening means include a cylindrical surface, and the slit-shaped indentation is formed on an end face of the cylindrical closure element.
3. (New) The closure device according to claim 1, wherein the closure element is symmetrical about an axis of the connection.
4. (New) The closure device according to claim 1, wherein the slit-shaped indentation is in the shape of a cross or a star.
5. (New) The closure device according to claim 1, further comprising a second wall opposite to the wall having the indentation, the second wall having an opening for passage of a fluid.
6. (New) The closure device according to claim 5, wherein a middle portion of the indentation is aligned with the opening.

A'
7. (New) The closure device according to claim 5, further comprising a surface extending around the opening in the second wall, the surface lying in a plane substantially perpendicular to a joining direction of the closure element to the connecting element.
8. (New) The closure device according to claim 1, wherein the closure element is formed of one piece.
9. (New) The closure device according to claim 1, wherein the wall and the closure element are made of plastic.
10. (New) The closure device according to claim 9, wherein the plastic is silicone.
11. (New) The closure device according to claim 1, wherein the wall comprises a spring element acting in a radial direction.
12. (New) The closure device according to claim 1, wherein the slit-shaped indentation forms a germ-proof closure adapted to withstand a pressure difference up to about ± 0.25 bar.
13. (New) A medical device having a plurality of connections for supplying or removing a fluid from the device, each of said connections comprising:
a closure element;
a wall formed in the closure element having an automatically closing slit-shaped indentation forming a germ-proof closure when closed; and
means for fastening the closure element to a connecting element disposed adjacent to the wall
14. (New) The medical device according to claim 13, comprising a filter module for one of dialysis, hemofiltration and ultrafiltration connected to the closure element.
15. (New) The medical device according to claim 13, wherein the closure element comprises one of an inside surface forming a germ-proof closure with the outside surface of

the connecting element, and an outside surface forming a germ-proof closure with an inside surface of a bushing-like connection.

16. (New) The medical device according to claim ~~13~~¹³, wherein the plurality of connections comprises at least two connections of the medical device, each connection being provided with a closure element.

~~17~~¹⁷. (New) A closure device for sterile closure of a connection of a filter module for dialysis, hemofiltration or ultrafiltration, comprising:

a closure element;

a wall formed in the closure element having an automatically closing slit-shaped indentation forming a germ-proof closure when closed;

means for fastening the closure element to a connecting element, the means fastening being disposed adjacent to the wall; and

a second wall adjacent to the fastening means, the second wall opposite to the wall having the indentation, the second wall having an opening for passage of a fluid.

18. (New) The closure device according to claim ~~17~~¹⁷, wherein the closure element is substantially cylindrical, the fastening means are cylindrical surface, and the slit-shaped indentation is formed on an end face of the cylindrical closure element.

19. (New) The closure device according to claim ~~17~~¹⁷, wherein the closure element is symmetrical about an axis of the connection.

20 (New) The closure device according to claim ~~17~~¹⁷, wherein the slit-shaped indentation is in the shape of a cross or a star.

21. (New) The closure device according to claim ~~17~~¹⁷, wherein a middle portion of the indentation is aligned with the opening.

- 22 (New) The closure device according to claim ²²17, further comprising a surface extending around the opening in the second wall, the surface lying in a plane substantially perpendicular to a joining direction of the closure element to the connecting element.
- 23 (New) The closure device according to claim ²³17, wherein the closure element is formed of one piece.
- 24 (New) The closure device according to claim ²⁴17, wherein the wall and the closure element are made of plastic.
- 25 (New) The closure device according to claim ²⁵24, wherein the plastic is silicone.
- 26 (New) The closure device according to claim ²⁶17, wherein the wall comprises a spring element acting in a radial direction.
- 27 (New) The closure device according to claim ²⁷17, wherein the slit-shaped indentation forms a germ-proof closure adapted to withstand a pressure difference up to about ± 0.25 bar.
- 28 (New) A medical device having a plurality of connections for supplying or removing a fluid from the device, each of said connections comprising:
- a closure element;
 - a wall formed in the closure element having an automatically closing slit-shaped indentation forming a germ-proof closure when closed;
 - means for fastening the closure element to a connecting element disposed adjacent to the wall; and
 - a second wall adjacent to the fastening means, the second wall opposite to the wall having the indentation, the second wall having an opening for passage of a fluid.
- 29 (New) The medical device according to claim ²⁹28, comprising a filter module for one of dialysis, hemofiltration and ultrafiltration connected to the closure element.

30. (New) The medical device according to claim ⁵~~28~~, wherein the closure element comprises one of an inside surface forming a germ-proof closure with the outside surface of the connecting element, and an outside surface forming a germ-proof closure with an inside surface of a bushing-like connection.

31. (New) The medical device according to claim ⁵~~28~~, wherein the plurality of connections comprises at least two connections of the medical device, each connection being provided with a closure element.

32. (New) A method for using a closure device for medical items, comprising the steps of:

disposing a closure element in facing relationship with a connecting tube;
pushing the connecting tube through a wall formed in the closure element, thus opening an automatically closing slit-shaped indentation of the wall forming a germ-proof closure when closed; and

attaching fastening means disposed adjacent to the wall for connecting the closure element to the connecting tube.

33. (New) The method according to claim ⁵⁵~~32~~, further comprising the steps of selecting the medical item to be a filter module for dialysis, hemofiltration or ultrafiltration, and using the connection between the closure element and the connecting tube for in-line sterilization of the filter module.

34. (New) The method according to claim ⁵⁵~~32~~, further comprising the step of placing the closure element on projecting connections of the fastening means.

35. (New) The method according to claim ⁵⁵~~32~~, further comprising the step of inserting the closure element into bushing-like connections of the fastening means.--.

Applicants maintain that new claims 1-²²~~35~~ are presently allowable, the earliest possible notice of which is earnestly solicited.

FEES

The Commissioner is authorized to charge any necessary fees or credit any overpayments under 37 C.F.R. §§ 1.16 and 1.17 to Deposit Account No. 11-0600.

Respectfully submitted,

KENYON & KENYON
